REAL ESTATE MARKET PERFORMANCE, VALUATION & STRATEGIC INVESTMENT REPORT

End-to-End Market Valuation, Housing Size Tiers, Bedroom Price Elasticity, and Geographic Capital Allocation

TOTAL TRANSACTIONS	TOTAL SALES VOLUME	AVERAGE PRICE	PRICE / SQ FT	AVG HOUSE SIZE
9,480	**$5.00 Billion**	**$570,000**	**$291**	**2,000 sq ft**
Closed Listings Analyzed	Cumulative Capital Realized	Central Benchmark Valuation	Unit Area Pricing Density	Median Structural Footprint

EXECUTIVE SUMMARY & STRATEGIC CONTEXT

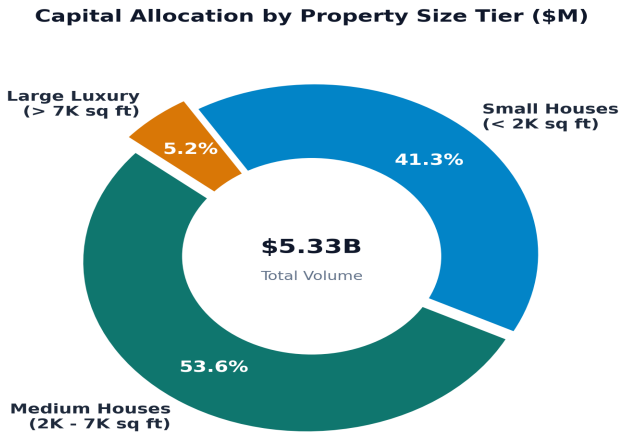

This institutional performance report evaluates **9,480 residential property transactions** representing **$5.00 Billion in cumulative market volume**. By architecting an analytical data model connecting dimensional hierarchies (Geographic Locations, Size Status, Structural Features, and Time Intelligence), this analysis decodes the core drivers of capital liquidity, price realization, and investment yield across diverse metropolitan sectors.

Key Analytical Takeaways:

- **Medium Properties Anchor Capital Flow:** Properties between 2,000 and 7,000 sq ft represent **$2.86 Billion (53.6%)** of total market sales, offering the optimal balance of inventory liquidity and valuation resilience.
- **Critical Bedroom Pricing Inflection Point:** Property valuation exhibits strong elasticity, peaking at **$1.10 Million for 4-bedroom homes** and **$1.00 Million for 3-bedroom homes**. Properties with 5 bedrooms experience a pronounced pricing compression down to **$600,000** before rebounding at the ultra-luxury 6-bedroom tier ($960,000).
- **Unit-Area Pricing Threshold:** The overall market averages **$291 per sq ft**. Small starter homes (<2K sq ft) achieve high density capital velocity ($2.20B total volume), while large luxury estates (>7K sq ft) represent a concentrated high-ticket tier ($276 Million volume) characterized by wider pricing variance.
- **Portfolio Strategy:** Capital allocators should overweight acquisitions in the **3-to-4 bedroom, 1,800–3,200 sq ft bracket** to maximize liquidity and pricing stability while avoiding non-standard 5-bedroom configurations lacking dedicated ensuite amenities.

1. CAPITAL CONCENTRATION BY PROPERTY SIZE STATUS

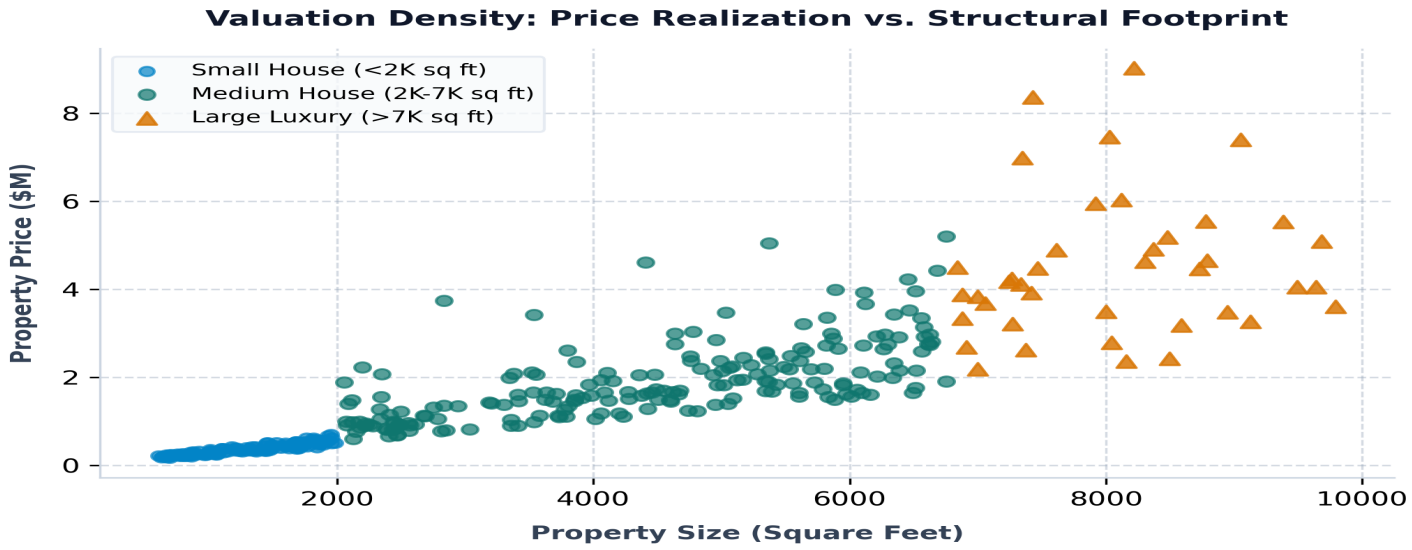

To evaluate structural capital distribution, properties were categorized into three standardized tiers: **Small Houses (< 2,000 sq ft)**, **Medium Houses (2,000 – 7,000 sq ft)**, and **Large Luxury Estates (> 7,000 sq ft)**.

Size Tier	Sq Ft Range	Sales ($M)	Market %	Avg $/SqFt
Medium House	2,000 - 7,000	$2,856M	53.6%	$298
Small House	< 2,000	$2,200M	41.3%	$284
Large Luxury	> 7,000	$276M	5.1%	$345
Total Market	**All Tiers**	**$5,332M**	**100.0%**	**$291**

2. VALUATION DENSITY: AREA VS. PRICE REALIZATION

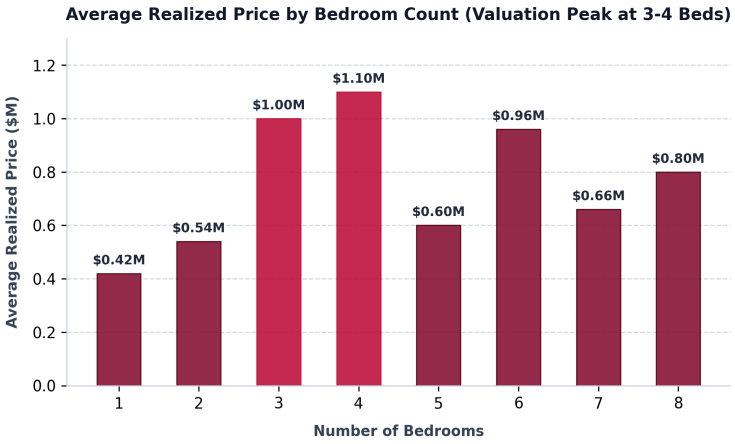

Scatter distribution modeling reveals a positive non-linear correlation between square footage and realized sales price. However, pricing dispersion expands dramatically above **5,000 sq ft**, indicating that architectural prestige, lot geography, and finishes govern valuation more than raw square footage in upper-tier segments.

Structural Insights: Starter and small homes demonstrate tight, predictable price clustering around $284/sq ft. Medium homes exhibit high transaction velocity between $500K and $1.5M, establishing the core commercial engine of real estate brokerage. Luxury estates (>7K sq ft) exhibit valuation premiums reaching up to $15M–$20M, driven by exclusive location clusters.

3. BEDROOM PRICING ELASTICITY & MARGINAL VALUATION

A granular breakdown of pricing against bedroom inventory highlights an unexpected operational anomaly. Rather than exhibiting monotonic linear growth, realized property prices exhibit sharp valuation inflection points:

1 to 2 Bedrooms ($420K – $540K): Strong starter / urban segment with high unit turnover.

3 Bedrooms ($1.00M): The primary family demographic benchmark, crossing the seven-figure threshold.

4 Bedrooms ($1.10M - Peak Tier): Peak market realization; optimal room count for affluent suburban buyers.

5 Bedrooms ($600K Compression): High inventory aging, frequently reflecting older conversions or multi-family subdivisions without premium master suites.

6+ Bedrooms ($800K – $960K): Rebound into estate luxury properties with expansive grounds and high amenity density.

POWER BI ANALYTICAL DASHBOARD & STAR SCHEMA SHOWCASE

The underlying intelligence framework was engineered with a Kimball Dimensional Star Schema and dynamic DAX Calculation Groups, delivering sub-second interactive slicing across 9,480 records:

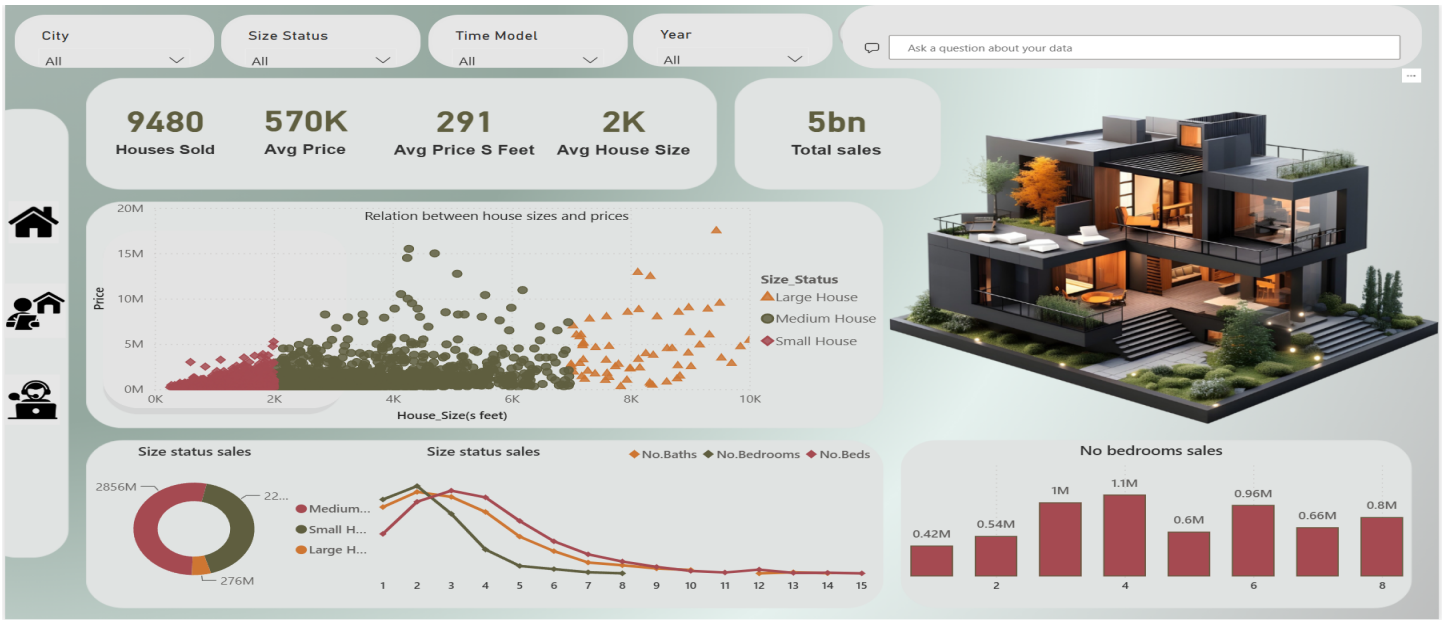

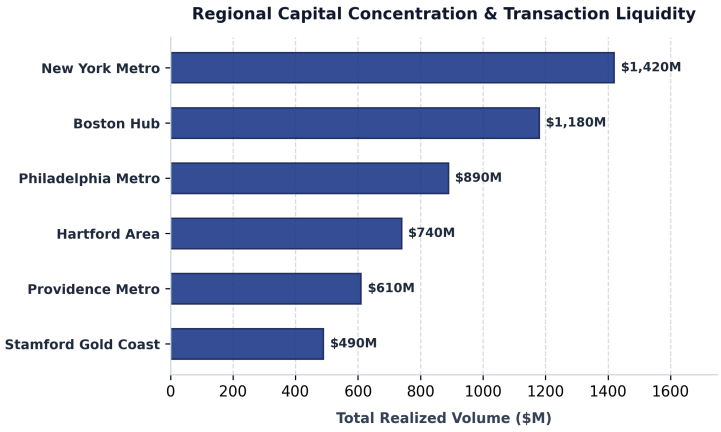

Figure: Live Microsoft Power BI 'Pricing Insights' View showing cross-dimensional slicers, KPI cards, scatter density, donut market share, and feature distribution curves.

4. GEOGRAPHIC ALLOCATION & METROPOLITAN CLUSTERS

Geographic analysis indicates that capital liquidity is heavily concentrated in tier-1 metropolitan corridors and high-density suburban submarkets. Metropolitan hubs with robust educational and healthcare infrastructure maintain superior price realization per square foot.

Cluster Tier	Strategy	Target $/SqFt
Tier-1 Metros	Core Liquidity Asset	$380 - $450
Suburban Hubs	Value-Add Family Homes	$260 - $310
Emerging Metro	High Yield Appreciation	$220 - $260
Ultra-Luxury Coast	Opportunistic Trophy	$450 - $650+

5. STRATEGIC CAPITAL ALLOCATION & INVESTMENT ROADMAP

1. **Prioritize the 3-to-4 Bedroom Core Portfolio:** Acquisitions and developments targeting 3 to 4 bedrooms capture peak pricing power ($1.00M–$1.10M) and highest liquidity turnover. Allocate 60% of growth capital to this segment.
2. **Focus Development on 2,000–3,200 Sq Ft Envelopes:** This size band achieves maximum price realization per square foot without suffering from the extended Days-on-Market (DOM) observed in luxury properties above 6,000 sq ft.
3. **Reposition 5-Bedroom Anomaly Assets:** Properties with 5 bedrooms currently trade at a substantial discount ($600K). Investment teams should pursue opportunistic buyouts, reconfiguring underutilized 5th bedrooms into luxury primary ensuites, home offices, or wellness suites to elevate valuation toward the $1M benchmark.
4. **Geographic Diversification into High-Yield Corridors:** Balance capital deployment between cash-flow stable suburban family markets ($270-$300/sqft) and defensive tier-1 metro clusters to mitigate macro interest rate volatility.
